BRIEFING FOR LASER COMPONENTS

LC Connect what it is and how it works

Monday, 5 October 2026 · prepared by AutoOffice

We do not train a model. **We build a harness.**

Harness = the connector in your service package of 15 September.

The engine

An OpenAI or Anthropic model. Rented by you, under your business plan; replaceable.

The harness

Tools for your products, lead base and rules. Designed to learn from every correction.

TRAINING YOUR OWN MODEL INSTEAD

Hundreds of thousands, **frozen** when finished, and GPUs to buy.

✗ Not a model fine-tune

✗ Not a CRM

✗ Not a data lake

✗ Not a closed system

Your data stays in one place you choose.
The engine is rented by you.

Security depends on the **contract**, not on the tool.

PLAN	TRAINED ON YOUR DATA	PROMPTS STORED	ZERO DATA RETENTION
Claude Enterprise (chat)	No, default	Yes, admin-set period	Not offered for the app
Claude API	No, default	≤30 days	By signed agreement CONTRACT
ChatGPT Enterprise (chat)	No, default	Yes, admin-set period	Not offered for the app
OpenAI API	No, default	Abuse logs ≤30 days	By request, EU residency option CONTRACT
Microsoft 365 Copilot	No, default	Yes, in your tenant	No such option
Grok API (xAI)	No, default	30 days	Admin toggle SETTING
Perplexity API used by LC Connect	No, default	Not retained	Yes, by default DEFAULT

Our rule: company business accounts only; pilot tests so far ran on personal accounts with public data.

Consumer plans train by default. Residency = where data rests + where inference runs.

Vendor pages as of 4 Oct 2026.

With LC Connect, the assistant finds **every prospect in your base.**

Test of 29 Sept, Claude and ChatGPT: *“Which companies use pulsed laser diodes?”*

FOUND IN LEAD BASE	POLAND	CZECH REPUBLIC
Without LC Connect	4–8 of 6–12 names	0–4 of 5–11 names
With LC Connect	16 of 16 Claude	14 of 14 ChatGPT

Trade fairs

About 65 % of suggested companies were worth the visit (Łukasz’s test).

Roles and audit trail

Personal sign-in. Every change logged.

One connector in your ecosystem, **not a system of its own.**

Each step is a connector you own or add later. The assistant does the office work between them.

Seven decisions. Then daily use becomes routine.

- 1 Green light for the formal pilot terms follow in Munich
- 2 Hosting choice A: your Azure · B: EU server
- 3 Identity provider for sign-in Entra ID / Google / Okta
- 4 NDA and data processing agreement signed before any company data goes in
- 5 Business workspace accounts for pilot users
- 6 Confirm the IT contact for security questions
- 7 A date in Munich second week of November

DAILY USE

You talk to it, typed or by voice.

The model is the clerk: speech into facts the system stores.

Changes are confirmed before saving; confirmation rules per tool.

Fewer slips: IDs and addresses come from the record.

Easy for the user, like a phone. The hard work sits behind it: prompts, roles, corrections. **That work is the service.**

Security pack in one page

Sign-in: OAuth 2.1 + PKCE, HTTPS, 4 h tokens

Roles: ADMIN, RESEARCHER, SALES; region-scoped editing

Limits: sign-in rate limits, request size limits

Backups: nightly, 30 days, on- and off-site

Perplexity: names, websites, questions; never notes, contacts

Target: your identity provider, your MFA

Audit log: every write, refused attempts too

Logs: structured, personal data redacted

Watchdog: full sign-in check every 5 minutes

Hosting: your Azure or EU server; AVV annex

Same system as in the **service package**

From the service package of 15 September, unchanged. Slide 3 is its simplified view.
